

Mobile App Wireframing

UI/UX Internship Task — Design Documentation

Project: Student Attendance Management System (Mobile App)

Prepared as: UI/UX Design Case Study

Deliverable type: Low-Fidelity Wireframes & UX Documentation

1. Problem Statement

Manual attendance tracking in colleges and schools is time-consuming, error-prone, and lacks transparency for students. Faculty spend valuable class time calling out names or passing sheets, records are frequently misplaced or miscalculated, and students have no easy way to check their own attendance percentage until it becomes a problem (e.g. being blocked from exams due to shortage). There is a need for a simple mobile application that lets students mark or view their attendance quickly, track their attendance percentage in real time, and receive timely alerts when attendance drops below the safe threshold, while giving faculty/admin a reliable digital record.

2. Target Users

- **Primary:** College/school students (ages 16–22) who need to mark and monitor their own attendance.
- **Secondary:** Faculty/class coordinators who verify attendance records generated by the app.
- **Tertiary:** Academic administrators who need consolidated attendance reports for compliance.

This wireframe set focuses on the **student-facing** mobile experience, as scoped in the task.

3. User Research — Pain Points & User Needs

Research Method

Since this is a self-driven internship exercise, research was conducted using quick-form methods: informal interviews with 5 college students, review of common complaints on student forums about manual attendance systems, and analysis of 2 existing attendance apps to identify usability gaps.

Key Pain Points

- Students don't know their live attendance percentage and are often surprised near exam time.
- Manual roll-call wastes 5–10 minutes of every class.
- No instant confirmation after attendance is marked — leads to disputes later.
- Notifications about shortage arrive too late (or not at all) for students to correct course.
- Attendance history is hard to verify subject-wise; students only see a single overall number.

User Needs (translated from pain points)

- A fast, low-friction way to mark attendance (QR/ID scan) instead of manual roll-call.
- An always-visible, real-time attendance percentage on the home screen.
- Instant confirmation feedback after marking attendance.
- Proactive alerts/notifications when attendance nears the shortage threshold.
- A detailed, filterable, subject-wise and date-wise attendance history.

4. User Personas

Persona 1: The Anxious Achiever

Aarthi Suresh, 20	<i>"I just want to know my attendance % before it becomes a problem."</i>
Role	III Year B.E. Computer Science student
Goals	Stay above 85% attendance at all times; get early warnings for shortage; avoid last-minute panic before exams.
Frustrations	Forgets to check attendance manually; current system only updates weekly; long queues for manual verification.
Tech comfort	High — uses multiple apps daily, prefers quick, minimal-tap interactions.

Persona 2: The Busy Multitasker

Rahul Menon, 19	<i>"Between practice and classes, marking attendance should take two seconds, not two minutes."</i>
Role	II Year B.Tech student, also a sports team member
Goals	Mark attendance quickly between back-to-back commitments; view a simple history if a dispute comes up.
Frustrations	Long manual roll-calls eat into break time; no proof of attendance when a class is missed for an approved sports event.
Tech comfort	Medium — comfortable with apps but impatient with slow or cluttered UI.

5. Design Thinking Process

Empathize

Conducted quick user interviews and reviewed common student complaints to understand real frustrations with manual and existing digital attendance systems.

Define

Defined the core problem: students lack real-time visibility into their attendance and a fast way to mark it, leading to anxiety and avoidable shortages.

Ideate

Brainstormed solutions: QR-based check-in, live percentage widget, push notifications for shortage risk, and a clean subject-wise history view. Prioritized features by impact vs. effort.

Prototype

Translated the prioritized ideas into low-fidelity grayscale wireframes covering the full journey — from splash screen to profile — kept intentionally simple to focus feedback on structure and flow rather than visuals.

Test

Planned validation approach: usability walkthroughs with 3–5 students using clickable Figma prototype, focused on task success rate for 'mark attendance' and 'check today's attendance %', followed by iteration on navigation and label clarity.

6. User Flow Diagram

Student Attendance App — User Flow

Figure 1 — End-to-end user flow from app launch to core feature screens.

7. Low-Fidelity Wireframes

All screens below are designed at 360×760 (mobile) in grayscale, using simple boxes, borders and labels — matching standard low-fidelity wireframing convention, ready to be rebuilt directly in Figma frames.

7.1 *Splash Screen*

The entry screen shown briefly on app launch. Displays the app logo, name (“AttendEase”), tagline and a loading indicator while the app checks session status.

7.2 *Login Screen*

9:41 100%

Login

Welcome Back!

Forgot Password?

LOGIN

or

[QR] Scan ID to Login

New student? Contact admin office

Lets returning/new students sign in using Student ID and password. Includes a 'Forgot Password' link and an alternate QR/ID-scan login option for faster access on shared devices.

7.3 Student Dashboard

The home screen after login. Shows an at-a-glance overall attendance percentage, quick-action buttons for 'Mark Attendance' and 'View History', and a subject-wise attendance summary list.

7.4 Attendance History

A filterable (by month) list of past attendance records with per-day status (Present/Absent/Late), letting students verify and cross-check records.

7.5 QR Scan / Mark Attendance

Camera viewfinder screen for scanning the classroom QR code to mark attendance in one step, with a manual code-entry fallback for when scanning isn't possible.

7.6 Notifications

A feed of system alerts — low-attendance warnings, confirmation of marked attendance, and timetable updates — each with a short description and timestamp.

7.7 Profile

Displays student identity (name, roll number, class) and a menu for editing profile, viewing the full attendance report, adjusting settings, getting help, or logging out.

8. Figma File Structure

Recommended page/frame organization for rebuilding this in Figma:

Page	Frame (in order)	Notes
■ Research	Personas, Empathy Map, Pain Points	Reference only, not part of app flow
■■ Flow	User Flow Diagram	One large frame, FigJam or frame w/ arrows
■ Wireframes — Low-Fi	01 Splash Screen	375×812 frame (iPhone base)
	02 Login	
	03 Student Dashboard	
	04 Attendance History	
	05 QR Scan / Mark Attendance	
	06 Notifications	
	07 Profile	
■ Components	Bottom Nav Bar, Buttons, Cards, Input Fields	Reusable low-fi components

Naming convention suggestion: **[Screen Number] - [Screen Name] - Lo-Fi** (e.g. “03 - Student Dashboard - Lo-Fi”), grouped inside a Frame named after the screen order shown above.

Summary

This document covers the complete low-fidelity wireframing exercise for the Student Attendance Management System mobile app: problem framing, user research, two personas, the design thinking process, a full user flow, and seven low-fidelity grayscale wireframe screens — ready to be rebuilt in Figma and user-tested in the next iteration.
